Economist specialized in data science with experience in the development and deployment of machine learning algorithms in the Peruvian banking sector. Solid academic background in econometrics, stochastic processes, and statistical modeling applied to financial data, as well as knowledge and experience in implementing these concepts in analytical systems using Python and cloud architectures. Focused on advancing the mathematical formalization behind quantitative models and their application to financial engineering systems.

PROFESSIONAL EXPERIENCE

Banco de Crédito del Perú - Culqi Lima, Perú
Data Scientist Jul 2025 – Present

- Designed and implemented supervised machine learning frameworks for churn prediction and fraud detection in Python, incorporating gradient boosting methods (e.g., XGBoost and CatBoost) and baseline statistical models to ensure performance benchmarking, model stability, and interpretability.
- Improved churn prediction performance (Recall: 0.50→0.77, Precision: 0.55→0.67) by applying temporal cross-validation schemes, addressing class imbalance, and refining SQL-based feature engineering pipelines to enhance model generalization.
- Developed time-series forecasting models (e.g., Prophet and autoregressive baselines) and applied dimensionality reduction techniques (PCA) to improve signal extraction in high-dimensional financial datasets, leveraging distributed data processing with PySpark for large-scale data handling.
- Led end-to-end deployment of ML models in batch environments using AWS SageMaker architecture, MLflow, and GitHub, ensuring reproducibility, experiment tracking, and governance standards across the model lifecycle.

Ernst & Young Perú Lima, Perú
Data Analyst Consultant Sep 2024 – Jul 2025

- Developed supervised learning models in Python (Scikit-Learn, TensorFlow) for credit risk scoring and fraud detection across U.S.-based financial institutions, integrating structured financial data with engineered risk features.
- Designed scalable SQL pipelines to process and validate large transactional datasets, performing anomaly detection and feature extraction for forensic financial investigations.
- Implemented deep learning-based similarity detection models for image and text data, leveraging vector embeddings and efficient nearest-neighbor search (e.g., FAISS) to identify fraudulent patterns in high-dimensional datasets.

Transfer Pricing Consultant Sep 2023 – Jun 2024

- Conducted financial benchmarking and valuation analysis for multinational banking and retail clients, utilizing Bloomberg and Refinitiv data to assess market returns, loan structures, and interest rate comparables (e.g., LIBOR-based benchmarks).
- Performed macro-financial analysis of corporate financial statements and cross-border transactions, supporting M&A and intercompany pricing assessments under international regulatory frameworks.

EDUCATION

2025 (ongoing)	MITx – Mathematical Methods for Quantitative Finance Stochastic Calculus, Linear Algebra, Probability Theory in Finance
2025	National University of Engineering (UNI) Specialization in Data Science (188 hours) – Final Grade: 18.6/20 Statistical Learning, Bayesian Methods, Deep Learning
2017–2023	Universidad Peruana de Ciencias Aplicadas (UPC) Bachelor's Degree in Economics – Top 20% of class GPA (4.0 scale): 3.72 Relevant Coursework: Macroeconometrics, Stochastic Processes, Mathematical Economics

TECHNICAL SKILLS

Programming	Python (NumPy, pandas, scikit-learn, XGBoost, TensorFlow, PySpark, Prophet), SQL, Spark, C++ (<i>foundations</i>)
Quantitative	Statistical Learning, Econometrics, Time-Series Modeling, PCA, Bayesian Methods
ML Systems	AWS SageMaker, MLflow, Git, Distributed Data Processing
